

#TimeLedger

Owner / Operations Guide

Public attraction template

Public build 0.1.0-alpha.14-public.1

A portable, local-first time ledger for attractions, tours, events, guest-service operations, seasonal venues, and similar teams.

Privacy note. Workforce exports may contain names, shift times, manager attribution, custom fields, and other employment data. Review files before sharing them.

1. What the public build is

#TimeLedger provides two self-contained browser applications: a Manager application for setup and supervised operations, and an Employee application for a simpler front-desk or employee clocking view. It is designed to work without an application server for ordinary use.

Core continuity model

- Full working state can be carried in a **.wps** file, an Offline Copy, or a state link.
- Routine CSV/PNG export is intended for new-to-export ledger data; the Manager ledger and full-state formats retain history.
- Local browser storage is a convenience backup, not a substitute for deliberate backups.
- Manager names and integrity hashes are local provenance signals; they are not remote identity authentication.

The public branding is #TimeLedger. The default organization name is Attraction Organization, and the default logo reference is TimeLedgerLogo.png.

2. Setup for an attraction or venue

1. Open **TimeLedger_Manager.html** in a modern desktop browser.
2. In Manager Setup, replace **Attraction Organization** with the organization or venue name and keep or replace the logo path.
3. Review the factory categories and positions. Edit them to match the way your operation assigns staff.
4. Open Spreadsheet Handler. Keep **Attraction Timesheet** or create/modify a profile to match your downstream timesheet workflow.
5. If date columns are needed, enter the schedule year, optional training/rehearsal date, and operating dates, then rebuild and commit the spreadsheet.

Factory categories

Category	Examples
Attraction Operations	Attraction Attendant, Operator, Queue Attendant, Lead, Manager
Attraction Tours	Tour Guide, Tour Host, Presenter, Tour Assistant, Lead, Manager
Guest Services	Admissions, Ticketing, Front Desk, Guest Services
Entertainment & Events	Performer, Event Host, Stage / Show Crew
Food & Beverage	Food Service, Cook, Server, Host
Facilities & Safety	Maintenance, Facilities, Custodial, Security, Safety
Support Staff	Admin, Marketing, Merchandise, Technical, Media, Fabrication

3. Attraction Timesheet and exports

The factory Attraction Timesheet begins with generic fields and no private seasonal dates.

Name		Department		Handbook		Orientation		Safety Training		Role Training		Total Hrs
------	--	------------	--	----------	--	-------------	--	-----------------	--	---------------	--	-----------

Verification curb

Curb Verification Data ON limits CSV output to the selected spreadsheet fields. Turning it OFF adds a Verification Data column at the beginning and a protected Field Map JSON column at the end.

Date aggregation

When date columns are configured, #TimeLedger aggregates eligible hours per employee and date into those columns. CSV imports may also carry roll-up hours without inventing exact clock-in or clock-out times.

Recommended owner review before payroll use

- Confirm employee name and department/attraction assignment.
- Confirm the selected spreadsheet profile and date window.
- Review any manual edits and training/checkoff fields.
- Confirm total hours against the Manager ledger and your organization policy.
- Archive the full .wps state before or alongside downstream processing.

4. Backup, privacy, and recovery

Suggested backup rhythm

- At the end of an operating day, create a **.wps** full-state backup.
- Before major roster/spreadsheet changes, create an Offline Copy or .wps snapshot.
- Keep exported payroll/timesheet files in access-controlled storage.
- Use synthetic data only when posting screenshots, issues, or examples publicly.

What may be sensitive

Real files can contain employee names, groups, job positions, work times, manager attribution, notes, schedule dates, training/checkoff status, and organization-defined fields. Treat those files according to your organization policy and applicable law.

Recovery order

1. If the current page still has the correct state, export a fresh .wps immediately.
2. If local state was lost, import the most recent trusted .wps or open a saved Offline Copy.
3. If merging a CSV into Manager, review the resulting ledger and roster before exporting again.

#TimeLedger is a time-ledger tool, not a payroll, tax, legal-compliance, or identity-authentication service. Configure and review it for your organization before relying on its outputs.

5. Public deployment checklist

- Place **TimeLedger_Manager.html**, **TimeLedger_Employee.html**, and **TimeLedgerLogo.png** together at the site/repository root.
- Run **bash scripts/verify_release.sh** before publishing a release.
- Run the included Playwright tests when Chromium and Playwright are available.
- Test the Manager and Employee pages at desktop and phone-width layouts.
- Do not publish real workforce exports as demo files.
- Choose and add the software license you intend to use before making licensing claims.

Compatibility

The public build retains the existing .wps extension and internal state/schema identifiers so compatible alpha.14-era state can still be imported. Public labels and factory data remain generic.
